of the rivers and seas; for when these are out of the water, the branchiæ very soon grow crisp and dry, the blood-vessels are shrunk, and the blood is obstructed in its passage; so, when the former are immersed in water, or otherwise prevented from having respiration, the circulation ceases, and the animal dies.

Again, as land-animals would be destroyed by too much maceration in water; so fishes would, on the other hand, be ruined by too much exsication; the latter being, from their general structure and constitution, made fit to bear, and live in the water; the former, by their constitution and form, to breathe and dwell in the air.

But it may be asked, why eels and watersnakes are capable of living longer in the air
than the other kinds of fish? This is answered
by considering the providential care of the
great Creator for these and every one of his
creatures: for since they were capable of loco-motion by their form, which they need not
be if they were never to go on shore, it seemed
necessary that they should be rendered capable
of living a considerable time on shore, otherwise their loco-motion would be in vain.—
How is this provided for? Why, in a most
convenient
