

with the slim needle-like leaves attached, of what seem to be from six to seven different species ; and it is worthy of notice, that they resemble in the group rather the coniferæ of the southern than those of the northern hemisphere.

Fig. 130.

CONIFERS ?

One sprig in my collection seems scarcely distinguishable from that of the recent *Altinga excelsa* ; another, from that of the recent *Altinga Cunninghami*. Lindley and Hutton figure in their fossil flora a minute branch of *Dacrydium cupressinum*, in order to show how nearly the twigs of a
