

*pus*; several new genera of the Hog family, among them species of *Elotherium* as large as a Rhinoceros.

The *Titanotherium giganteum* of Leidy (1852) is one of the earliest species discovered in the White River region. The restoration, Fig. 1533,  $\frac{1}{45}$  the natural size, is by Scott and Osborn. The length was over 13 feet.

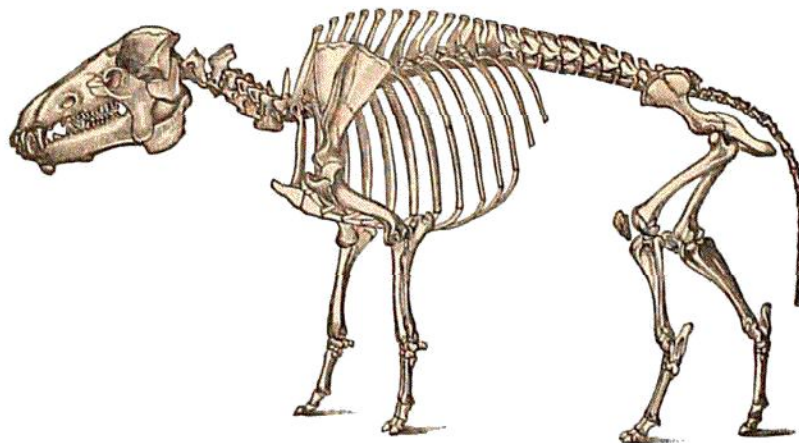

1534.

Restoration of *Brontops robustus* ( $\times \frac{1}{40}$ ). Marsh.

Fig. 1534 represents a restoration,  $\frac{1}{40}$  natural size, of another of these Titanotheres, the *Brontops robustus* of Marsh. The length of body was nearly 12 feet.

1535.

*Elotherium crassum* of Marsh ( $\times \frac{1}{30}$ ).

A restoration of one of the Artiodactyl Ungulates is shown in Fig. 1535, representing a large species of Elotherium, *E. crassum* of Marsh. Its length was about seven feet. Its remains occur in Colorado and South Dakota.
